

BigPicture integration

What is the integration with BigPicture?

The Dashboard Hub Pro and BigPicture integration brings the BigPicture powerful project portfolio for data management into the Dashboard Hub centralized and shareable dashboards.

Create custom visual charts with your project data and generate centralized dashboards to grant stakeholders and managers a unified view of multiple projects, progress, resource utilization, and overall status.

How does it work?

Users can now add the new [BigPicture Custom Charts gadget](#) to their dashboards and shape their project portfolio management data visualization according to their unique needs.

What problems does it solve?

It expands data visualization over BigPicture built-in reports, allowing more customization, flexibility, and shareability in your reporting process.

With this integration, what can I do now that I couldn't before?

You can:

- Create custom BigPicture charts and dashboards.
- Share dashboards externally with password-protected links, in seconds.

- Combine and integrate different data sources, instances, and products into the same dashboard, creating a single reference point for their team. By having all the data in the same place, users can stop jumping from one tool to another. Teams migrating can display data from different instances to ease their migration journey.
 - Thanks to the Dashboard Hub family of apps, you can access the BigPicture metrics from Jira, Confluence, Bitbucket, or even monday.com.
 - Leverage all of Dashboard Hub's powerful features:
 - Advanced restrictions/permissions on charts and dashboards.
 - Dynamic filtering.
 - Creating custom charts with JQL and formulas.
 - Use of templates.
 - Nearly 100 prebuilt Jira metrics, and more.
-

How does it help work to flow?

When using Dashboard Hub to visualize and report on BigPicture data, you gain better visualization and control over key insights.

What is the most important feature everyone should know about this integration?

Besides improving visualization and simplifying the reporting of BigPicture data, Dashboard Hub becomes the central data hub where teams align and coordinate, saving teams from jumping through different tools to fetch data.

This is achieved by leveraging Dashboard Hub product integrations and creating unified and centralized dashboards where teams can check all their relevant data across products at a glance.
